

How to get approval for your cert from CA?
1) you need to create a CSR (certificate signed request)
along with your public key, domain name
openssl req -new -key my-bank.key -out my-bank.csr

They will sign and send the CSR.
But, Hacker's will be rejected by ~~CSR~~ companies.

How do browser ~~get~~ confirm if CA is valid? Trust Symantec.

Like other, CA's have public and private keys.

public keys - safari, chrome, etc browser can use

private keys - will be used at the time of signing the certificate and sending it to server.

private CA:- used for Internal ~~CA~~ websites.
like sparsh etc.

Symantec CA can be deployed as Internal CA and you need to install their public cert in all user's browser.
